Dear Josh,

It was good to see you the other day and I hope St. Louis wasn't too fatiguing.

We have tested the following cultures with $10^4 \mu$ TMG and found following results

W 2242 no detectable enzyme

W 2244 " " "

W 481 about $\frac{1}{50}$ enzyme of wild type

W 2241 " " " " "

So as you suggested W 481 may be a lec.

I enclose some TMG and I am eager to learn what you find regarding the response of various mutants to TMG as compared with bulg-gal and others. (If you plan to do this).

Regards to Esther & happy St. Valentine Day

Aaron
